# What Is A Chiropractic Adjustment?

*The winds of grace blow all the time. All we need to do is set our sails.*  
—Ramakrishna

## **What Is A Chiropractic Adjustment?**

A chiropractic adjustment is a highly specialized procedure your doctor of chiropractic uses to free your body from a serious form of health-destroying stress called the subluxation.

What is a subluxation? Simply stated, a subluxation is a distortion in your body structure that interferes with the nerve communications in your body.

How do you know if you have a subluxation? While there are some simple things that will tell you if you might have one, chiropractic education involves years of study and training for your chiropractor to master the techniques needed to locate and correct your subluxations.

## **Artistic And Scientific**

When you first visit your chiropractor you will receive a chiropractic structural analysis to determine where and how many subluxations are in your body.

Once your chiropractor has determined the location of your subluxation(s) using various tools of analysis, he/she must determine the following:

- In which direction is the subluxation out of alignment or distorted?
- What is the body trying to do to this area of stress and tension?

*All chiropractors have the same goal—the elimination or reduction of your subluxations, reducing the stress on your nervous system.*

- What is the minimal amount of force necessary for realignment?
- Which is the best technique (style of adjusting) to use?
- Are there any factors which would contraindicate or prevent the adjustment?
- Is the patient relaxed enough for the adjustment?
- Which subluxations are primary and which are defensive or secondary?

### **A Checklist**

An experienced chiropractor may quickly go through a mental “checklist” of the above. Chiropractors may also include in the checklist a certain “feeling” when an adjustment is just right. This “feeling” can’t easily be put into words, but when the chiropractor has you under his or her hands, intuition and experience come into play. This includes a sensitivity of the patient knowing that every person is unique. No two adjustments are ever the same.

### **Physical Differences**

An adjustment from one chiropractor may feel different when given by another chiropractor. One reason for this is that each chiropractor is physically unique: some are tall, some are short, they have different sized hands and they may use different adjusting techniques. These differences are natural when dealing with adjusting, for it is an artistic as well as a scientific procedure.

### **The Same Goal**

But all chiropractors have the same goal—the elimination or reduction of your subluxations to decrease the stress on your nervous system to permit you to unleash your inner healing ability.

### **Putting The Bone In Place?**

Your chiropractor is not really “putting the bone back in place.” The adjustment is unlocking the jammed tissues and body parts from their stuck or fixated positions. They are then free to move where the body wants them to go. Only the body knows exactly where its parts need to be. The chiropractor can, however, make a reasonable determination of the general direction using analysis tools: motion palpation, study of the electrical quality of the muscles (S-EMG), imaging tools such as MRI and X-ray, biofeedback and autonomic awareness and other tools.

*The chiropractic profession has developed nearly 100 different methods to release spinal and nerve damage.*

### **The Body Is Always Trying**

If your body is out of alignment it is always trying to realign itself and return to a state of ease or relaxation. It is unnatural to be under stress or tension—it is natural for it to be released. Your muscles are continuously working to put your body parts

back to where they should be. The chiropractor doesn’t actually put the part back in place—he/she supplies just the little bit of force needed to free it so your body will realign it.

### **Like A Stuck Car**

As an example, let's say your car is stuck in the mud or snow and its wheels are spinning and spinning. Then along comes a friend who pushes the car—the wheels finally catch—and the car jumps out of its rut. Now ask yourself, "Did your friend really push your two-ton car out of the mud?" Of course not! He just supplied the right amount of force in the right direction that the car needed to dislodge itself.

### **Do Chiropractors Need To Be Strong?**

Do you have to be strong to give an adjustment? No, strength is not necessary—skill is. An adjustment has little to do with actual strength since the body is always trying to pull the vertebra back into proper alignment and release unnatural stress from your muscles, tissues and joints. Most of the force is already there, locked up but not moving. The chiropractor has the right “key” to open the “locked”

**An adjustment permits your entire body to receive more life-giving energy and information.**

areas. Just the right touch in the correct direction (at the proper moment) should be all that is needed. Some adjusting techniques use so little force patients barely feel anything! A small female chiropractor of slight build, can, with the proper adjusting technique, move man-mountains.

### **Chiropractic Adjusting Techniques**

Not all chiropractors work alike. The chiropractic profession has developed nearly a hundred different techniques to analyze the body for subluxations and adjust or release them.

Each chiropractor usually has a favorite technique that he or she employs for the majority of patients. Why not ask what type of adjusting technique he or she uses and why?

**Chiropractic adjustments are safe, gentle and effective.**
