By the time a child is 6-months-old they are to be injected with at least 62 vaccines; at 18 months at least 87, and at 6 years – based on the 2014 CDC recommended schedule

To protect my baby from being injected with toxic poisons. In addition to live and killed bacteria, virus and their toxins, children are injected with some of the most lethal poisons known: formaldehyde; mercury; aluminum; phenol (carbolic acid); borax (ant killer); ethylene glycol (antifreeze); dyes; acetone (nail Polish remover); latex; MSG; glycerol; polysorbate 80/20; sorbitol; monkey, cow, chic, pig, sheep and dog tissues and cells (may be contaminated with animal viruses); gelatin; casein; human fetal cells, human viruses; antibiotics, genetically modified yeast, and animal, bacterial and viral DNA (may affect recipient's DNA).

I don't want to play Russian roulette with my child. No one knows the chances of your child being hurt or killed from a vaccination because only a fraction of children who are hurt is ever reported. According to the US Food and Drug Administration, MDs underreport vaccination injuries by 90%. Another report revealed that only one in 30 vaccine-injured children (2%) is ever reported. Why would that be? There are a number of reasons. One is that most medical doctors do not know how to identify a vaccine reaction. Another is that they refuse to acknowledge that such reactions are inherent in vaccination. After all, they were taught in medical school that vaccines are safe. A third reason is that it is hard to admit that something they did to help a patient caused that patient harm.

Childhood diseases almost completely disappeared before vaccination. The death rate from mumps and pertussis (whooping cough) had decreased over 90% before widespread vaccination. The measles death rate had decreased nearly 98%. Diseases for which no vaccines were introduced, such as scarlet fever and typhoid fever, also decreased in virtuality. “Nearly 90% of the local decline in mortality (scarlet fever, diphtheria, whooping cough, and measles) between 1860 and 1900 occurred before the introduction of antibiotics and widespread immunization.” According to Robert Mendelsohn, MD: “There is no convincing scientific evidence that mass inoculations can delay or prevent a natural disease from occurring even if the vaccine is effective.”

There is no proof the polio vaccine decreased polio. Additionally the polio vaccine is linked to cancer. Due to improper filtering, a monkey virus (SV40) was included in the polio vaccine. SV40 is highly carcinogenic (cancer-causing) and is linked to brain tumors, bone cancers, malignant mesotheloma (lung lining cancer) and non-Hodgkin’s lymphoma.9

I don’t want my baby to get incompletely tested drugs. Vaccines are not tested for their ability to cause cancer, mutations or developmental malformations. They are also tested for their affect on a child’s reproductive system. Shampoos and cosmetics are tested for carcinogenicity but vaccines aren’t.

I don’t want my child to get cancer. Pediatric cancer rates have been rising 13% a year since 1974 and cancer is currently the 2nd leading cause of death in children (after accidents). Leukemia and brain tumors, the most common childhood malignancies, are rising dramatically.

“I have been mumps and measles for cancer and leukemia?” asks Robert Mendelsohn, MD. Vaccination of childhood is linked to autoimmune diseases, skin diseases, degenerative diseases of bone and cartilage and tumors in adult life.12

I don’t want my child to have cancer. Vaccination is unnatural. Diseases contracted naturally are filtered through immune system defenses (i.e. skin and mucous membranes). However, vaccines are introduced into a child’s body unnatural—directly into the bloodstream. The vaccine ingredients (bacteria, virus and toxins) access to all of the major tissues and organs of the body without the body’s normal advantage of a total immune response.

I want my child to have natural immunity. Vaccinations are unnatural. Diseases contracted naturally are filtered through immune system defenses (i.e. skin and mucous membranes). However, vaccines are introduced into the body unnatural—directly into the bloodstream. The vaccine ingredients (bacteria, virus and toxins) access to all of the major tissues and organs of the body without the body’s normal advantage of a total immune response.

I want my child to be free of autism and learning disorders. After years of denying a link between vaccination and autism, on November 9, 2007 the US government in Court of Federal Claims admitted that vaccines can cause autism.13 This followed years of thousands of parents reporting their normal, healthy children descended into autism after receiving DT, MMR or other vaccines. Medical researcher Harris Coulter, PhD reports: “Between 15 and 20% of American school children are considered learning disabled with minimal brain dysfunction directly caused by vaccine damage.”

Dr. Coulter’s estimate (1990) is now a fraction of the larger number of vaccine-damaged children. For example, by 2008 five million US children ages 3-17 were classified as learning disabled, a three-fold increase since 1970-77, with comparable increases in attention deficit hyperactive disorder (ADHD) and asthma.14 A 2003 study found that up to 10 percent of American children (7.4 million) have learning disabilities.15

No one knows if vaccine damage can surface years later. There are no adequate studies to determine the long-term effects of vaccines on our children and future generations.16 According to Guylane Lanctot, MD, “Vaccination is a disaster to the immune system. It actually causes a lot of illnesses. We are changing our genetic code through vaccination.”

The flu vaccine has been linked to Alzheimer’s disease and dementia. According to Hugh Fudenberg, MD, the world’s leading immunogeneticist, if an individual has had five consecutive flu shots his/her chances of getting Alzheimer’s disease is ten times higher. Is this why Alzheimer’s is expected to quadruple?17

I want my child to have permanent immunity. Only natural immunity lasts a lifetime and vaccines don’t provide natural immunity. Also, when children are permitted to have infectious diseases of childhood they naturally lower their risk of cancer and heart disease in later life.18

The vaccines don’t work. Outbreaks have occurred in 100% vaccinated populations.19 In one school, out of 137 children who contracted measles, 98.7% were vaccinated.20 Another study found that getting a pertussis (whooping cough) shot increases the chances of getting pertussis.

Vaccination dosage isn’t personalized. A 5-pound premature baby will get the same dosage as a 60-pound 6-year-old. There is no personalization for weight, health or any other reason. A single vaccine given to a 6-year-old infant is the equivalent of giving an adult 30 vaccinations on the same day.

To promote a natural, drug-free lifestyle. How can we tell our children to avoid drugs if we drug them throughout childhood? How can we teach our children that drugs are bad if we take them all the time?

Our children are injected with dangerous toxic chemicals that have no benefit and may cause diseases far worse than what they are designed to “prevent.” Natural immunity is safer; natural immunity promotes healthier children, and natural immunity lasts forever.

In addition, as early as January 2004, the American Academy of Pediatrics announced in the “AUTISM A.L.A.R.M.” bulletin, that 1 in 6 American children were diagnosed with a developmental disorder and/or behavioral disorder. Vaccination is creating a generation of neurologically-damaged children. If we include other types of vaccine damage such as allergy (including food allergy) and asthma, the numbers are far higher.

Vaccines interfere with transplacental immunity. Transplacental immunity is the protection the fetus receives from the mother before birth (through the placenta). When a little girl is vaccinated she does not develop all the natural immunity she should have. When she becomes pregnant she cannot pass on as much protection to her unborn baby. That is why measles now occurs in children less than one year old and adults over twenty-five, ages where it can be fatal. This was unheard of before vaccination. Vaccines interfere with the age of occurrence of childhood diseases.19

According to Hugh Fudenberg, MD: “The flu vaccine has been linked to Alzheimer’s disease and dementia. Vaccination dosage isn’t personalized. A 5-pound premature baby will get the same dosage as a 60-pound 6-year-old. There is no personalization for weight, health or any other reason. A single vaccine given to a 6-year-old infant is the equivalent of giving an adult 30 vaccinations on the same day.”
